Champ-Track FPU WaterPlay Surface Maintenance

Champ-Track FPU is an impermeable surface consisting of 2 layers of solvent-free polyurethane elastomer with rubber crumb cast into each layer during the installation process. The result is a resilient, textured surface that provides slip resistance.

This surface is generally considered low maintenance as the surface is impermeable to water and any contamination or debris would be confined to the surface. As a result larger debris can be removed with a broom or blower.

Depending upon the location of the surface, there could be animal feces, bird dropping or other organic materials such as grass or algae, pressure washing with less than 1200 psi should be sufficient, however where additional cleaning is required a mild detergent may be used. For heavy soiling, a disinfectant-sanitizer by Hunting Laboratories called Beaucoup available from ECOLAB may be used. When properly diluted to the instructions provided with the product and following application instructions followed by properly rinsing and disposal should be sufficient.

Note that prior to the use of any chemical cleaning agent, the user must consult with local environmental agencies as to the suitability for the particular location.
